

Autoadvance

There are two ways to perform autoadvance:

- ▶ pressing the ENTER key
 - ▷ for the textarea element – press `Shift+Enter` keyboard shortcut (`Ctrl+Enter` shortcut for [Screen Flows client mode](#))
- ▶ when the number of entered characters in control equals the *maxlength* value (not supported on a textarea element)

It is possible to set the `tabindex` attribute to -1 in order to skip a focus on the element.

```
<htmltag data-flx-autoadvance = "[true/false]" maxlength = "[number]"></htmltag>
```

HTML Layout Editor/HTML Editor

```

1 Serial Numbers <br/>
2 <input type="text" data-flx-autoadvance="true" maxlength="8" /> <br/> <br/>
3 <input type="text" /><br/> <br/>
4 <input type="text" /><br/> <br/>
5 <input type="text" /><br/> <br/>
  
```

HTML code

Runtime

Serial Numbers

1234-AE1

The control is focused when the number of entered characters equals the maxlength value (in this example the value is set to 8)
