

CSS Style Maintenance

It is recommended to use the already defined CSS classes. The CSS Framework is supported in the client mode. For details, see the [CSS Framework Documentation](#).

If it is necessary to define a new CSS class in order to add some visual attributes to some parts of a designed Screen, there are the following options available.

These are the recommended options:

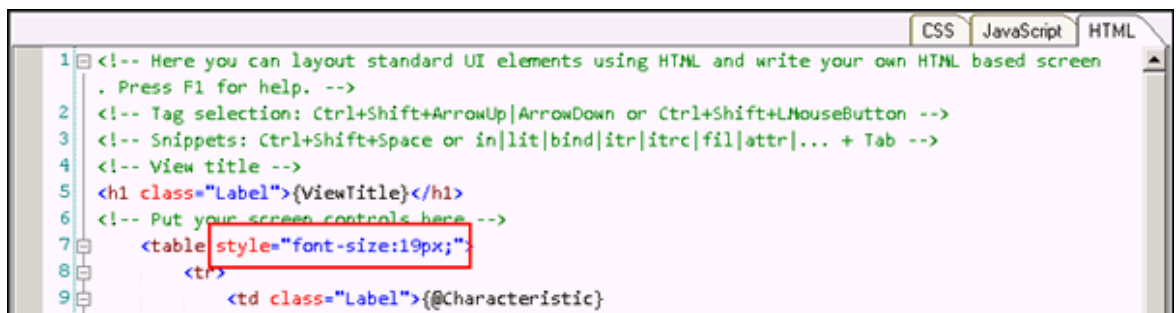

- ▶ Use the configuration (recommended option)
 - ▷ New CSS classes and properties can be added via the **CSS Classes** and **Inline Styles** properties available on the [Layout: General Tab](#) and [View: Advanced Tab](#)
 - ▷ As an example, some CSS properties can be defined at the Panel definition level to position the Panel correctly on the Screen
 - ▷ The Layout will only affect the way each Panel is rendered, not its content
- ▶ Using an external CSS file
 - ▷ For example, a new class in the interpreter CSS that will affect all the specified elements
 - ▶ Such a change should always be validated, as changes done in such a file will globally affect all the elements to which the file is applied
 - ▶ This is especially critical when adding or modifying the properties of an existing CSS class (as this kind of change will have global impact)

There are other possible options, but they are not recommended practices:

- ▶ Using the [CSS Tab](#) in the HTML Layout Editor
 - ▷ CSS properties can be defined that will affect all the elements of a specific Screen but which are not proper for global application
 - ▷ An example of such usage would be the need to apply some additional CSS properties to the standard Buttons or to overwrite some existing properties, in which case it is possible to define a new CSS class in the CSS tab and apply it to a Button directly in the HTML Layout Editor
 - ▶ Such configuration will not affect the standard behavior of the Buttons and adds the possibility to customize if necessary
 - ▷ For more information, see [Styling](#)

This is not a recommended option.

- ▶ Using the CSS properties added directly in the HTML Layout Editor
 - ▷ If some CSS property needs to be applied to a specific part of the Screen (with a specific HTML tag) to affect this single entity, it can be done directly in the HTML Layout Editor

A screenshot of a code editor window with tabs for CSS, JavaScript, and HTML. The HTML tab is active, showing a code snippet. Line 7 contains the code `<table style="font-size:19px;">`, where the inline style attribute is highlighted with a red rectangle. The code includes comments for help, tag selection, snippets, and view title, as well as a placeholder for screen controls.

```
1 <!-- Here you can layout standard UI elements using HTML and write your own HTML based screen
   . Press F1 for help. -->
2 <!-- Tag selection: Ctrl+Shift+ArrowUp|ArrowDown or Ctrl+Shift+LMouseButton -->
3 <!-- Snippets: Ctrl+Shift+Space or in|lit|bind|itr|itrc|fil|attr|... + Tab -->
4 <!-- View title -->
5 <h1 class="Label">{ViewTitle}</h1>
6 <!-- Put your screen controls here -->
7 <table style="font-size:19px;">
8   <tr>
9     <td class="Label">{@Characteristic}
```

► For more information, see [Styling](#)

This is not a recommended option.

Limitations

Using inline styles with Views comes with the following limitations:

- Width and height cannot be applied.
- Vertical margins cannot be applied.
- Vertical paddings can overlap with the padding of the parent element.
- Transform cannot be applied.
