

# CSS Tab

It is recommended to use the already defined CSS classes. The CSS Framework is supported in the client mode. For details, see the [CSS Framework Documentation](#).

The CSS tab allows for writing and including your CSS styles.

Depending on the scope of your styles it may be defined in the following places:

- ▶ In the HTML tab
- ▶ In the CSS tab
- ▶ In an external file (for a specific Theme)

| Styles Location      | Runtime Behavior                                                                                                                                                                    |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>HTML tab</b>      | Styles will be generated per each instance of the DFC or HTML View on the screen.                                                                                                   |
| <b>CSS tab</b>       | Styles will be generated once per all instances of the same DFC (e.g., an iterated sub-DFC) or HTML View on the screen.                                                             |
| <b>External file</b> | Style links will be generated once per all instances of the DFCs or HTML Views where it is included (files need to be included in a specific <a href="#">Theme</a> folder/folders). |

Refer to [Styling](#) to see examples that present the cases mentioned above. Refer to [How to Use Font Icons](#) for examples of using icon classes.
