

Define a Step Routing Output

Setting the routing output on a step defines the navigation flow of the step. [Test Run](#) uses the defined output value to run the DFC according to the designed path of step navigation.

1. Select the step in which the routing output is to be defined.
2. Right-click the step and choose **Set Routing Output** from the [right-click menu](#). The **Function Outputs** window appears.
3. Select an output from any of the available functions. Click **OK** to return to the navigation diagram.

The types of the allowed outputs: **Char**, **Integer**, **Boolean**, and **Decimal**.

Steps with a set routing output become [decision steps](#) with a  indicator displayed on the step [information bar](#).
