

Determination Function

Determination is used to generate Outputs based on a combination of values from Inputs. In runtime, Determination checks whether values passed to the Inputs of the Function match the values defined in the Determination Editor. Next, the Function returns Output values based on those matches. The comparison of the Input values is performed according to the row Sequence Number.

To Add the Determination Function

1. Drag the Function Determination from the **Toolbox** to the Function Navigation diagram, or double-click the Determination icon in the Toolbox.

☐ Match All

Edit determination

2. To add Inputs and Outputs to the Function, the user has to open the Determination Editor. Every Input and Output has its type and a set of values.

Field	Description
Determination Type	The user can choose the type of Determination, First Match or Match All: ▶ First Match – the Function stops searching for Input values combinations after finding the first match. Other possible matches will be ignored, and there will be only one result in the output. ▶ Match All – the Function continues looking for matches after finding a match. There may be more than one result in the output. For this reason, the data type of Outputs is automatically set to "List of..."
Edit Determination	Opens the Determination Editor.

Determination Editor

The Determination Editor allows the user to configure a sequence of Inputs and Outputs with permitted values.

Determination Editor

Sequence No	In1	In2	Out1	Out2
▶ 10	1	1	23	33
20	2	3	10	19
30	11	23	55	65
