

Export and Import an Action Script

Process Builder provides all the necessary tools to edit Action Scripts. However, it may be easier to edit longer and more complicated Action Scripts in the third-party editors that contain more advanced language support.

Export

If you do not want to use Process Builder for writing your Action Script's code, you can export the Action Script to separate files by following these steps:

1. Open the [Action Scripts Manager](#).
2. Choose the **Export** option from the [Entity Explorer Right-Click Menu](#). This option is available only for Action Script root elements and Action Script Categories.
3. The **Export Action Script** dialog box appears, where you can select the following:
 - ▶ **Action Script Revision** – this drop-down menu contains the Action Scripts revisions that can be exported (only Action Scripts of the selected revision will be exported)
 - ▶ **Destination directory** – the folder on your computer where the Action Script files will be saved

Once all the data is saved, a confirmation is presented that the save action was successful.

The exported files will be saved into the selected folder in two additional directories:

- ▶ **lib** – this folder contains additional DELMIA Apriso libraries; you can use the functions from these libraries in your Action Scripts
- ▶ **src** – this folder contains the exported Action Script revisions

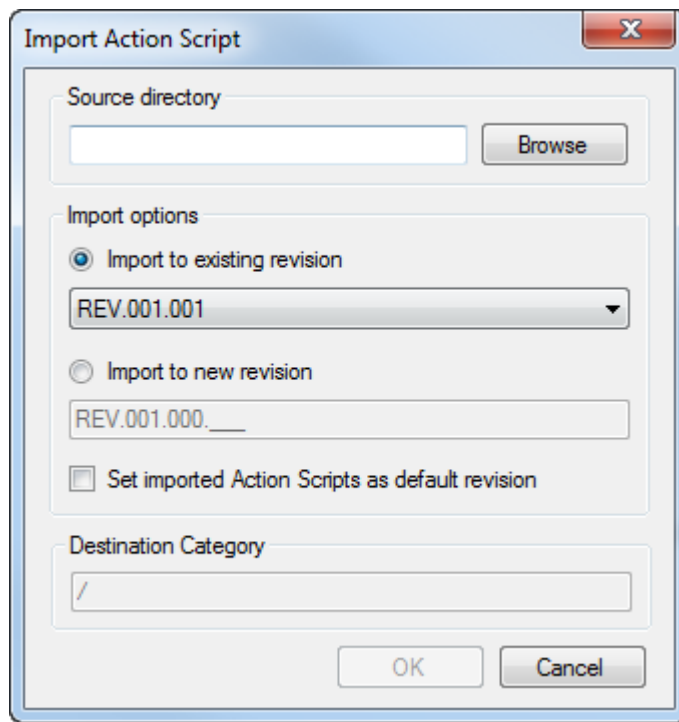

Import

Once you finish your work with the Action Scripts in another editor, you can import them back into Process Builder by following these steps:

1. Open the **Action Scripts Manager**.
2. Choose the **Import** option from the **Entity Explorer Right-Click menu**. This option is available only for Action Script root elements and Action Script Categories.
3. The **Import Action Script** dialog box appears, where you can select the following:
 - ▷ **Source directory** – the folder from which you import the Action Script
 - ▷ **Import options:**
 - ▷ Import to existing revision

Be aware that Action Scripts with the same names and revisions as the imported ones will be overridden and moved to the imported category.

- ▷ Import to new revision – create a new Action Script revision
- ▷ **Set imported Action Scripts as Default Revision** – if you are sure that the imported Action Scripts are correct, you can set them as the default revision so that you can use them immediately after importing

The dialog box is titled "Import Action Script" and features a standard Windows-style title bar with a close button (X) in the top right corner. It is organized into four main sections:

- Source directory:** Contains a text input field and a "Browse" button to the right.
- Import options:** Contains two radio buttons. The first, "Import to existing revision", is selected and is followed by a dropdown menu showing "REV.001.001". The second, "Import to new revision", is unselected and is followed by a text input field containing "REV.001.000.____". Below these is a checkbox labeled "Set imported Action Scripts as default revision", which is currently unchecked.
- Destination Category:** Contains a text input field with a "/" character.
- Buttons:** At the bottom right, there are "OK" and "Cancel" buttons.
