

HTML View: CSS Tab

The CSS tab allows for writing and including your CSS styles.

Depending on the scope of your styles it may be defined in the following places:

- ▶ In the HTML tab
- ▶ In the CSS tab
- ▶ In an external file (for a specific Theme)

Styles Location	Runtime Behavior
HTML tab	Styles will be generated per each instance of the DFC or HTML View on the screen.
CSS tab	Styles will be generated once per all instances of the same DFC (e.g., an iterated sub-DFC) or HTML View on the screen.
External file	Style links will be generated once per all instances of the DFCs or HTML Views where it is included (files need to be included in a specific Theme folder/folders).

Refer to [Styling](#) to see examples that present the cases mentioned above. Refer to [How to Use Font Icons](#) for examples of using icon classes.
