

HTML View: JavaScript Tab

The JavaScript tab allows for writing and including your JavaScript (functions, plugins, and variables).

Depending on the scope of your functions, it may be defined in the following places:

- ▶ In the HTML tab
- ▶ In the JavaScript tab
- ▶ In an external file

Script Location	Runtime Behavior
HTML tab	The script will be generated per each instance of the DFC or HTML View on the screen.
JavaScript tab	Functions, plugins, and variables will be generated once per all instances of the same DFC (e.g., iterated sub-DFC) or HTML View on the screen.
External file	Script links will be generated once per all instances of the DFCs or HTML Views where it is included.

Refer to [Scripting](#) to see examples that present the cases mentioned above.

To Enable IntelliSense

To enable IntelliSense in the JavaScript tab, press `CTRL+SPACE` . A list of suggestions will appear.
