

Input Source: Previous Function

The general properties available for all inputs are described in the [Input Properties](#) topic.

The screenshot shows a 'Properties' dialog box with the following sections:

- General**
 - Name: Input1
 - Description: (empty text area)
- Data Type**
 - Char (selected)
 - Integer
 - Decimal
 - Boolean
 - DateTime
 - Complex
 - Scalar (selected)
 - List
 - List (Iterate)
 - List (Duplicate)
- ☒ Use Source Value Copy
- Input Source**: Previous Function (selected in dropdown)
- Previous Function Output**: (not set) (selected in dropdown)

Previous Function Output is a combo box with a list of all of the defined Function Outputs that match the Input data type (this list contains only Outputs with data types convertible to the Input data type). The Function Input as Output from Previous Function works in the context of a single Step.

If you intend to share Inputs and Outputs between Steps, you should be using a Session Variable and not a Output from Previous Function.
