

Layout Editor Overview

The Layout Editor in Process Builder is used to design the User Interface of Steps in a convenient visual way, and includes the ability to position screen elements and **grids** (deprecated).

The editor of the User Interface for Steps is integrated with the Function Editor. You can switch between the following views:

- ▶ **Function Navigation** screen (for the Process Technical Author Role)
- ▶ **Sub-DFC** view
- ▶ **Layout Editor** screen
- ▶ **HTML Layout Editor** screen

Layout Editor makes it possible to edit the layout of User Interface elements:

- ▶ **Function Inputs**
- ▶ **Function Outputs**
- ▶ **Business Controls**
- ▶ **Sub-DFCs**
- ▶ **Machine Inputs**
- ▶ **Grids (Deprecated)**

The central part of the screen contains a design area for user controls. The controls are related to Inputs, Outputs, and Functions inside a Step.

On the right side of the screen, the system should display the properties of Inputs, Outputs, Business Controls, Sub-DFCs, and grids. When the user selects an element in the central part of the screen, the system shows an appropriate editor in the Properties pane.

The user can resize Business Controls with the Layout Editor by selecting the control and dragging the border (some Business Controls such as Quality Defect and Flat File Mask Editor have predefined minimum sizes).

In the Layout Editor, the system displays the style (such as font color, size, etc.) as defined by the user (by setting direct formatting or CSS style).

The user can freely change the position of the elements (Business Controls, Input and Output Controls, grids) when the absolute position option is enabled (use the Absolute Position check box in the Advanced properties of the control, or drag-and-drop the elements while holding the Alt key [the check box will be automatically selected]).

If Business Controls or Sub-DFCs Functions have an iterated or duplicated Input, the Function is marked in the Layout Editor. For more information, see [Input Properties](#).
