

Local Determination Function

Local Determination is an expanded version of Determination. The Inputs, Outputs, and their values are defined for the whole system, not for a particular Function. It is possible to set date ranges for when particular values of Local Determination are valid

The values and date ranges of Local Determination can be configured in [Determinations](#) screen.

To Add the Local Determination Function

- 1. Drag the Local Determination Function from the [Toolbox](#) to the Function Navigation diagram, or double-click the Local Determination icon in the Toolbox.

- 2. Choose the Determination name from a drop-down list. Once the Determination is selected, Inputs and Outputs are created based on data from the Determination configuration.

Field	Description
Determination	A list of Determinations created in Determination screen. The list is refreshed upon clicking on the drop-down.
Disable Error on Missing Match	A Disable Function fail on a missing match of the sequence. If selected, a new Boolean Output called NoMatchingSequence is added to the Function. The additional Output can be handled by subsequent Functions such as User Formula or Show Message.

Determination Type	The user can choose the type of Determination, First Match or Match All: ▷ First Match – the Function stops searching for Input value combinations after finding the first match ▷ Other possible matches will be ignored, and there will be only one result in the Output ▷ Match All – the Function continues looking for matches after finding a match ▷ There may be more than one result in the Output, and for this reason the data type of the Outputs is automatically set to "List of..."
