

Logging Debug, Info, and Error Messages

It is possible to log messages when Action Scripts are executed in runtime. These messages are logged based on the Logging Configuration of the DELMIA Apriso server. When executing the script in the Action Script test mode, the messages are logged in the [Action Script Output](#) tool pane.

The available message types are:

- ▶ Debug
- ▶ Info
- ▶ Error

Code	Description
<code>DebugConsole.LogDebug(message: string, params: any[]) : void</code>	Logs Debug messages.
<code>DebugConsole.LogInfo(message: string, params: any[]) : void</code>	Logs Info messages.
<code>DebugConsole.LogError(message: string, params: any[]) : void</code>	Logs Error messages.

Sample Usage

The below sample code logs an Info message with 3 parameters defined:

```
DebugConsole.LogInfo("Info: Three parameters {0}, {1}, {2} message", 1, "2", "another");
```
