

MIScript Function

MIScript is a Function which can operate on Machine Integrator data such as Data Sources, Points, etc. The Scripts that are exposed by the MI connector facilitate information exchange between MI and other Apriso modules. Inputs for the Scripts can be used together with Point values to produce advanced interaction scenarios and return calculated results.

To Add the MIScript Function

1. Drag the MIScript Function from the [Toolbox](#) to the Function Navigation diagram, or double-click the MIScript icon in the Toolbox.
2. Choose the Script lookup mode (either By Connector or By Equipment):
 - a. Choose Connector from the drop-down list. The Connectors can be managed on the Machine Integrator Configuration screen.
 - ▷ Choose the Script from the drop-down menu. The Script's Inputs and Outputs are automatically added to the Function.
 - ▷ When needed, specify the ConnectorAlias Input value that overrides the Connector alias used in runtime.
 - b. Choose Equipment from the drop-down list. It can be managed on the Equipment Explorer M&M screen (MI configuration screen).
 - ▷ Choose the Action from the drop-down menu. The Action's Inputs and Outputs are automatically added to the Function.
 - ▷ When needed, specify the Equipment and Facility Input value that overrides the Equipment used in runtime.

Script Inputs and Outputs

Name	Type
------	------

Field	Description
Script lookup mode The mode that gives the Process Author a possibility to choose the way of referencing the MI Script which should be executed. There are two ways: ▶ by Connector using Script ▶ by Equipment and its Action	
By Connector	The drop-down consists of names of Connectors that are created on the Machine Integrator Configuration screen.
Using Script	Scripts that are available for the selected Connector. The MIScript Function editor does not show disabled scripts in the list.
By Equipment	The drop-down consists of a list of Equipment that is created on the Equipment Explorer screen or Machine Integrator Configuration screen.
Using Action	Actions available for the selected Equipment.
Script Inputs and Outputs	The list of Inputs and Outputs available in the chosen Script.

If there is a problem with executing MIScript using Process Builder (i.e., there is an error saying that the machine actively refuses the connection but, for example, Monitoring is working), refer to *Guidance for configuring IPv6 in Windows for advanced users* at Microsoft Support.

To read more about MI Scripts, please see the **Machine Integrator Guide**.
