

HTML Layout Editor Overview

At some point working with the Layout Editor might not be enough and the need for building more sophisticated and complex screens may arise. For this purpose, the HTML Layout Editor functionality can be used.

It should particularly be used when there is a need:

- ▶ For a more flexible way of designing the layout of User Controls on the screen
- ▶ To refresh some data on the screen asynchronously
- ▶ To build a custom user interface element

In other cases you should keep using Layout Editor.

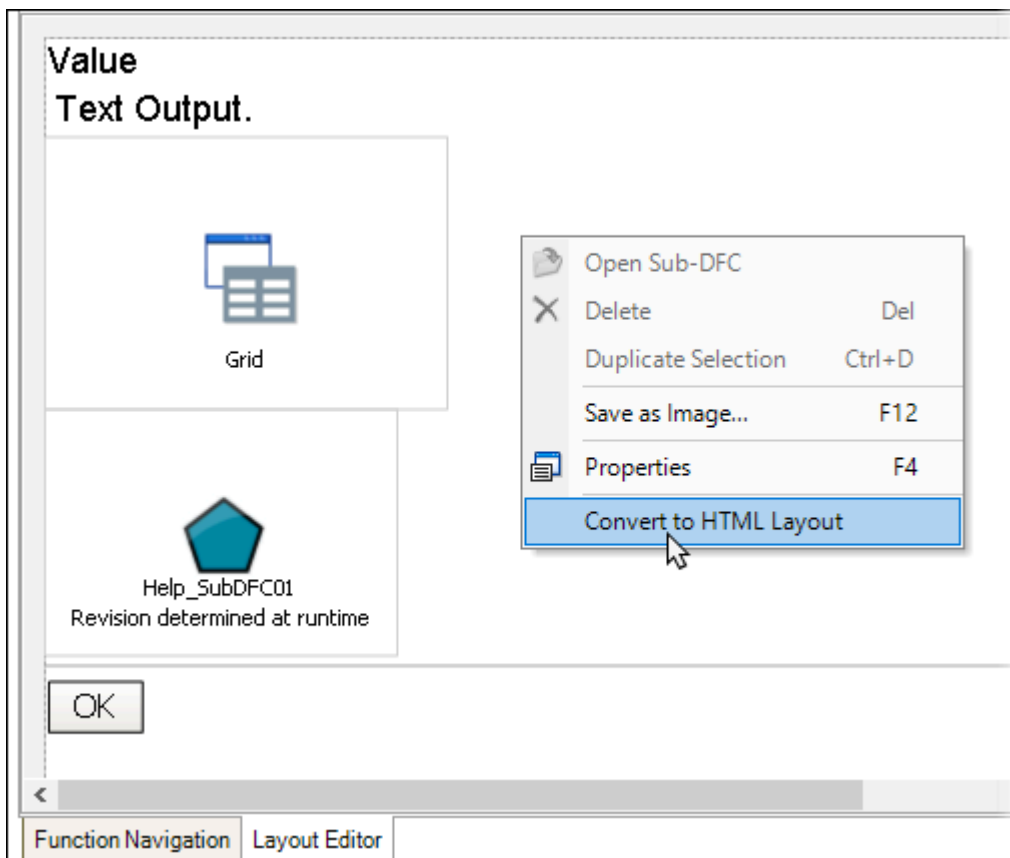

The HTML Layout Editor's functionality mainly allows for:

- ▶ Arranging the layout of current Process Builder Business Controls, User Inputs and Outputs, and Sub-DFCs with the use of HTML
 - ▶ For this purpose, a basic knowledge of HTML is required
- ▶ Calling an DFC asynchronously from the Web page
 - ▶ For this purpose, JavaScript and HTML knowledge is required
- ▶ Writing custom HTML-based User Interface elements
 - ▶ For this purpose, more advanced knowledge of HTML, JavaScript, and CSS is required

Conversion from Layout Editor

To convert screens designed in the Layout Editor to the HTML Layout Editor, use the **Convert to HTML Layout** option from the **HTML Layout Editor Right-Click Menu**.

Using the HTML Layout Editor overrides the layout created with the use of the Layout Editor. To go back to the Layout Editor, you need to use the Switch back to Layout Editor option from the right-click menu.
