

Operation Navigation Overview

The functionalities related to process authoring are deprecated and will not be further developed.

For more information on operation navigation, refer to ***Explosion, Navigation & Tasking Guide***.

The operation navigation view is available when you open a process entity. The view consists of two tabs:

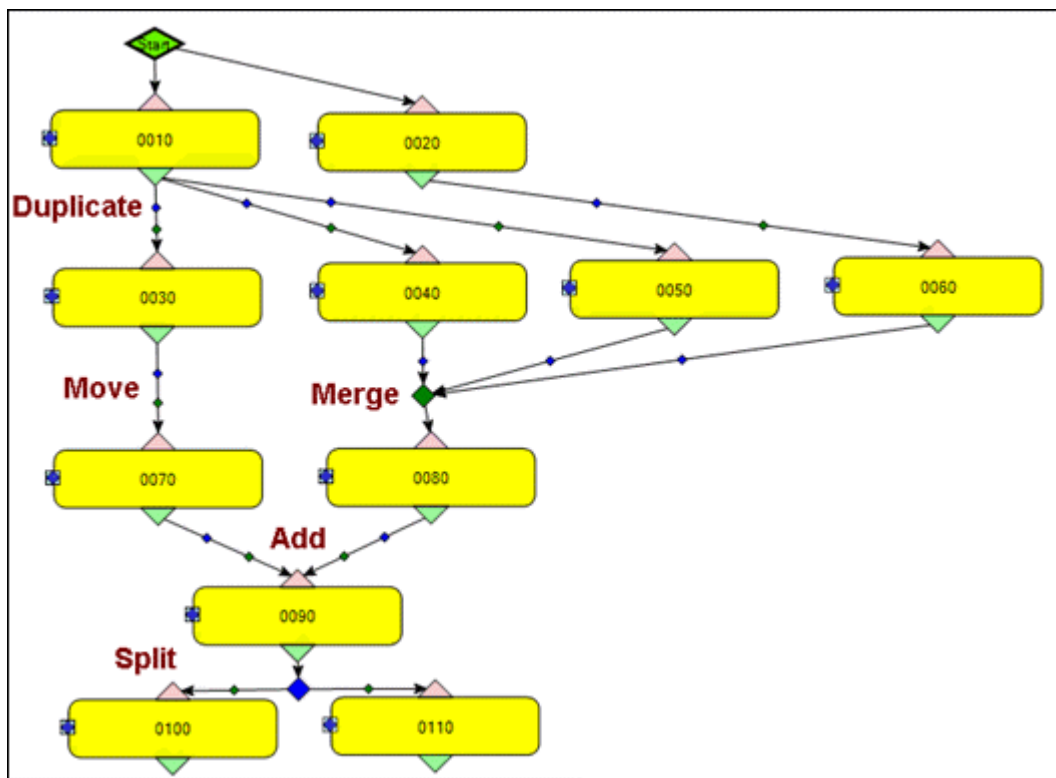

- ▶ **Navigation** – represents the movement of quantities (or progress) between process operations or work orders. Operation navigation triggers tasking and moving quantities according to the connector lines through a process or operations that make up a process.
- ▶ **Links** – displays a list of [links](#) that are added to the process.

Operation navigation determines where, when, and how to move quantities based on process design and order reporter (good, fail, scrap, alternative, or reason code). The navigation is triggered by report production. For "first" operations, operation navigation is triggered by explosion.

Operation Navigation Diagram

For more information on an alternative view of the operation navigation diagram, see [Operation Navigation PERT View](#).

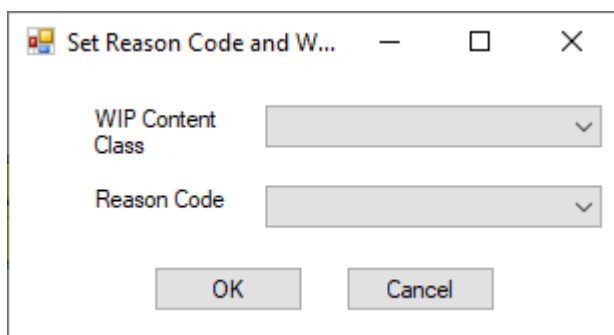

Symbols

The  symbol indicates the point where the navigation can split into multiple operations, and the  symbol indicates the point where the navigation can merge back to a single operation.

Connector Line Descriptions

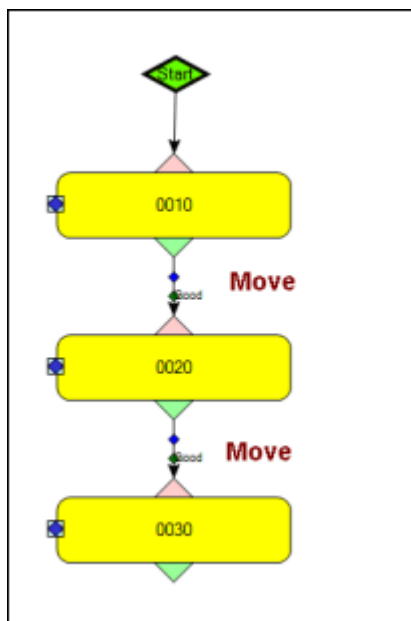

When you connect two diagram elements with a connector line, the system displays a pop-up window where you can set a WIP content class and reason code. Their visibility on the diagram can be set with the **Show Reason Code Description** and **Show WIP Content Class Description** right-click options.

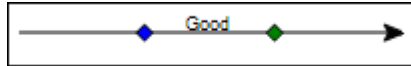

Navigation Actions

Operation navigation can be broken down according to the following actions:

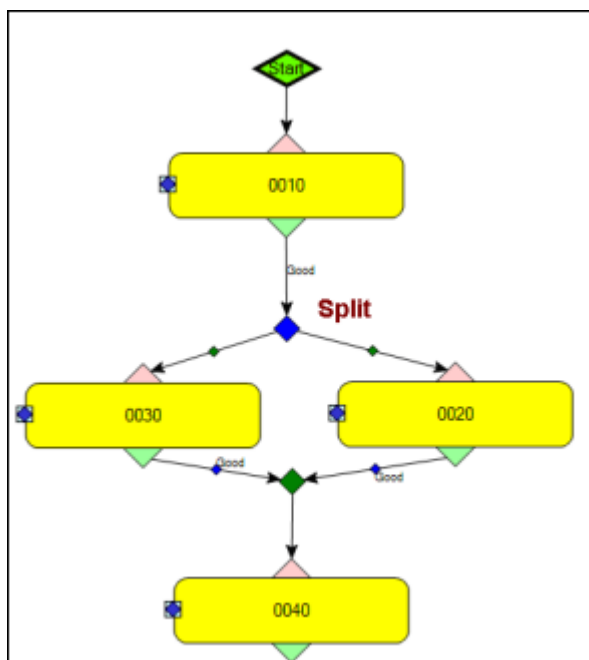

- **Move** – transfer quantities from one operation to the subsequent operation.

1. Draw a line out of **Operation 0010** into **Operation 0020**.
2. Draw a line out of **Operation 0020** into **Operation 0030**.

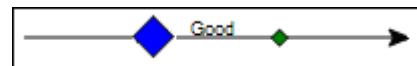

- **Split** – move quantities between two or more operations.

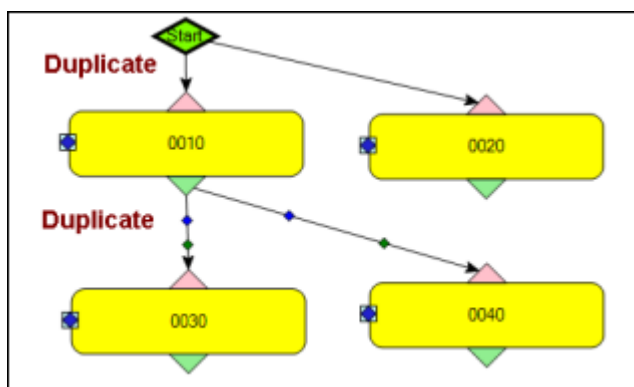

1. Draw a line out of **Operation 0010** and into **Operation 0020**.
2. Draw a line out of **Operation 0010** into **Operation 0030**.

When the line is created, the **◆** symbol is enlarged to **◆** on the line.

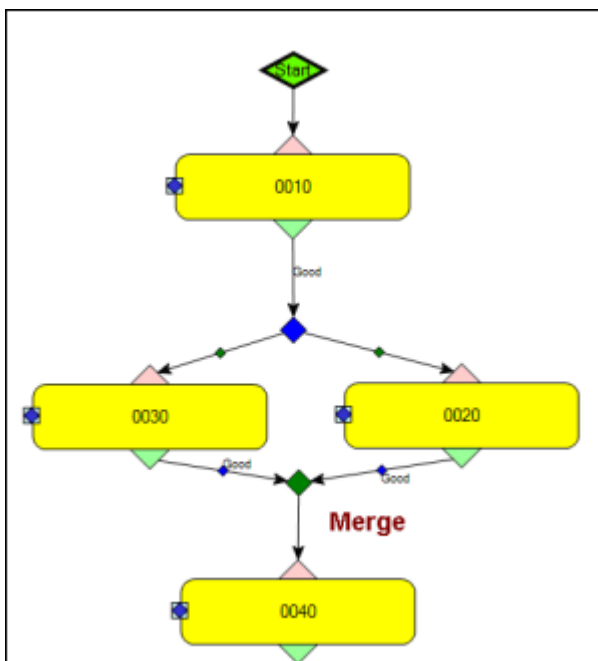

- **Duplicate** – move quantities to more than one subsequent operation, or initialize more than one operation at the time of explosion.

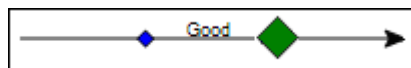

1. Draw a line out of **Start** into **Operation 0010**.
2. Draw a second line out of **Start** into **Operation 0020**.
3. Draw a line out of **Operation 0010** into **Operation 0030**.
4. Draw a second line out of **Operation 0010** into **Operation 0040**.

- **Merge** – combine quantities from two or more preceding operations.

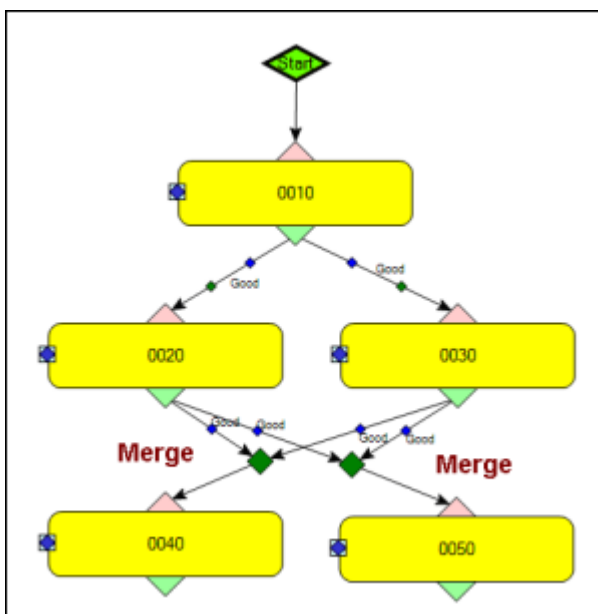

1. Draw a line out of **Operation 0020** into **Operation 0040**.
2. Draw a line out **Operation 0030** into **◆**.

When the line is created, the **◆** symbol is enlarged to **◆** on the line.

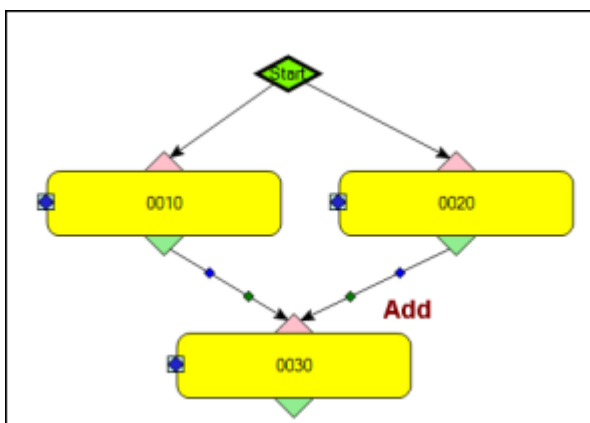

Merge with dependencies

Merging with dependencies entails the same action as the merge, however, you can build in multiple dependencies on preceding operations. In this example, the quantity must be reported for both **Operation 0020** and **Operation 0030** before **Operation 0040** and **Operation 0050** can be started.

- **Add** – add quantities received from two preceding operations.

1. Draw a line out of **Start** into **Operation 0010**.
2. Draw a second line out of **Start** into **Operation 0020**.
3. Draw a line out of **Operation 0010** into **Operation 0030**.
4. Draw a line out of **Operation 0020** into **Operation 0030**.

How To

[Enable or Disable Editing of the Operation Navigation](#)

[Print the Operation Navigation Diagram](#)

[Save the Operation Navigation Diagram as an Image](#)
