

Raising Errors from Scripts

It is possible to display error messages to the user in the following ways:

- ▶ By providing a hard-coded message of the error (the message displayed to the user will *not* be localized)
- ▶ By providing an error code defined in the [Dictionary screen](#) (the message displayed to the user will be localized)

The error codes in the Action Scripts are available as functions of the `ErrorCodes` object.

Code	Description
<code>throw ErrorCodes.GenericMessage(message: string, params: any[])</code>	Displays a generic message with the provided text.
<code>throw ErrorCodes.YourErrorCodeName();</code>	Displays the <code>YourErrorCodeName</code> error code that should be defined with the same name as the error code in the Dictionary Manager .
