

Screen Literals

Literals can be added in HTML tab.

```
{@Literal name}
```

The screenshot shows the HTML Layout Editor/HTML Editor interface. On the left, the 'Screen Literals' section is expanded, showing a list of literals with 'ScreenName' selected. Below this, a table lists device prompts for 'Desktop', 'Mobile', and 'Text', all showing 'Sample Screen Name'. The main editor area displays the HTML code for the selected literal, which is a paragraph tag containing the literal name. The 'Runtime' tab on the right shows the 'Sample Screen Name' and an 'OK' button.

Device	Prompt
Desktop	Sample Screen Name
Mobile	Sample Screen Name
Text	Sample Screen Name

```
<p>
  {ScreenName}
</p>
```

Sample Screen Name

OK

Mobile and Text platforms are no longer supported.

The (remove) button in the **Screen Literals** section is active only for literals that are not used in the HTML tab (they were removed from the HTML tab).

Supported Literal Formats

Format	Description
{@literal}	Default format. Literal will be rendered in HTML inside a <code></code> element.
{@literal:text}	Text format. Literal will be rendered in HTML as plain text, without a <code></code> element. This format can be used when inserting literals inside HTML attributes, example: <pre><input type="text" placeholder="{@InputSerial:text}" /></pre>
