

System Parameters

The System Parameters tool pane shows all of the System Parameters along with the System Parameter Categories they belong to.

Field	Description
Filter	Enter the name of the System Parameter or System Parameter Category that you want to find.
Show used onlycheck box	If selected, only System Parameters that are used in the opened entity are displayed.

Drag-and-Drop Actions Available on System Parameters

- ▶ From the pane to the Function's Input – the system changes the Input source
- ▶ From the pane to the Function, between Inputs – the system creates a new Input with the source set to the existing System Parameter
- ▶ It is also possible to drag-and-drop multiple System Parameters
- ▶ When dragging-and-dropping a System Parameter, an Input is created based on the System Parameter data type
- ▶ Validation returns an error when an Input data type is not compatible with a System Parameter data type

It is possible to see where a System Parameter is used. After selecting a System Parameter in the System Parameter tool pane, Entity Explorer highlights the Function Inputs which use this variable (parent entities are highlighted if children nodes are collapsed in order to facilitate navigating to specific Function Inputs).

For information about the System Parameter Input source, see [System Parameter](#).

It is possible to refresh the view in System Parameters by right-clicking on the system parameter in the tool pane and choosing **Refresh** from the right-click menu.
