

Test and Debug Action Scripts

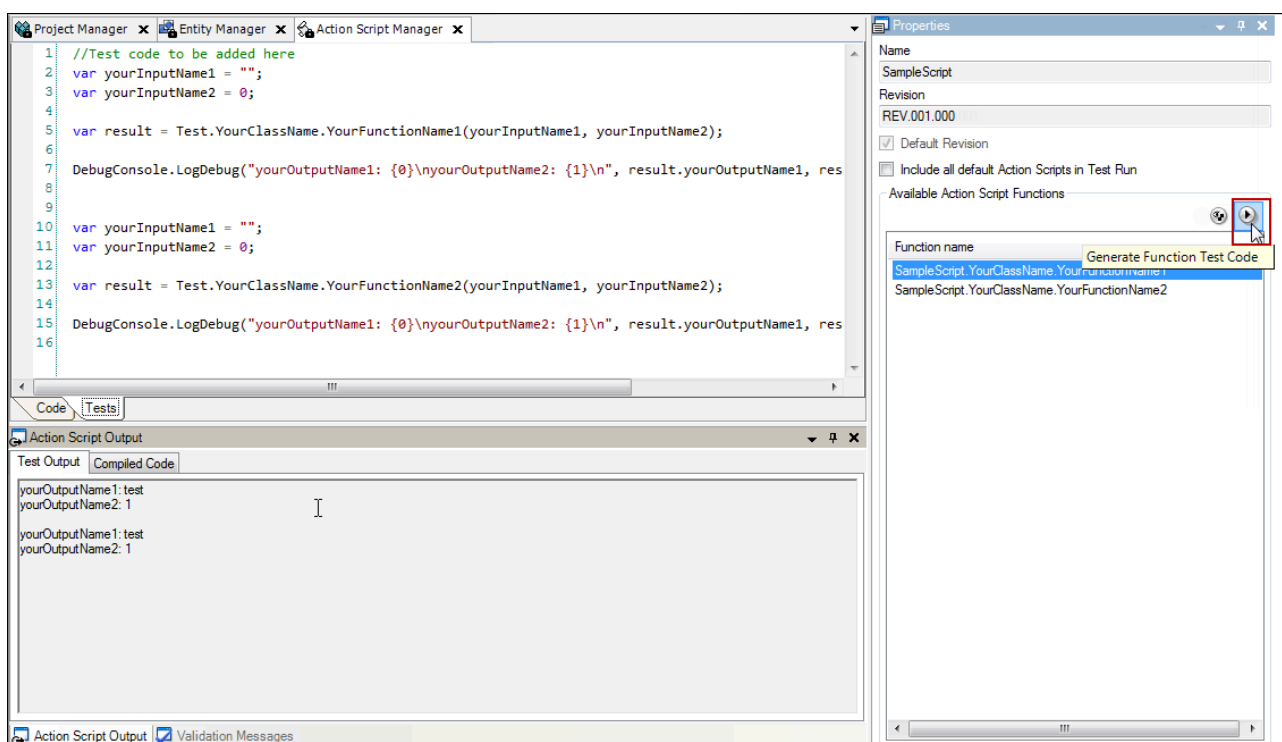

To Test and Debug an Action Script:

1. Open the Action Scripts Manager and navigate to the **Tests** tab:

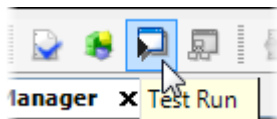

2. Create a testing code that will call an Action Script Function, execute it, and display the logged data by following these steps:
 - a. Select the Action Script Function on the [Action Script Revision Properties](#) pane.
 - b. Click  (Generate Function Test Code), and an initial code will be inserted into the **Tests** tab.

Each revision of an Action Script has its own test code.

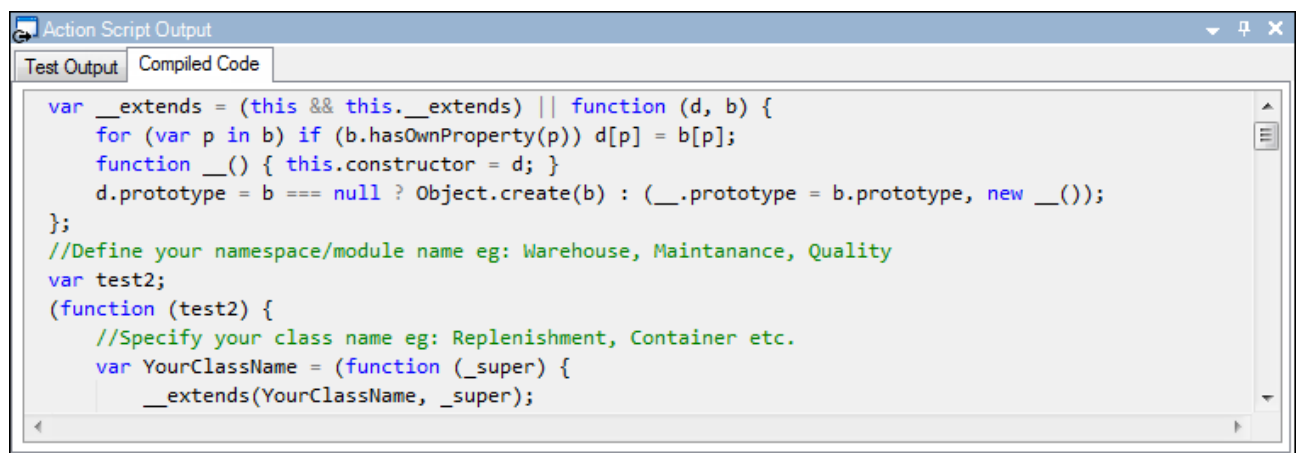

3. Click  (Test Run) on the **Toolbar** to execute the testing of the code:

The results of the Action Script execution are displayed in the **Test Output** tab of the **Action Script Output Tool Pane**. To enable the display of information in this tool pane, you need to use the *DebugConsole* function named *LogDebug* in the test script. See this example:

```
DebugConsole.LogDebug("yourOutputName1: {0}\nyourOutputName2: {1}\n",
result.yourOutputName1, result.yourOutputName2);
```

You can verify the compiled code used in the Test Run on the **Action Script Output** tool pane (**Compiled Code** tab):

4. Click  (Validate) on the **Toolbar** to check the validity of the displayed code.
5. Select the **Include all default Action Scripts in Test Run** check box on the **Action Script Revision Properties Pane** if your Action Script uses Action Script Functions from other Action Scripts (otherwise, the Action Script will not be tested). This option is not selected by default, because it may slow down the execution of the test and is only required in this particular situation.
