

View Action: Parameters Tab

The **Parameters** tab lists all the External Inputs defined by the user in the View DFC (see [DFC Interface](#) tab) linked to the Action and the fields from the [Forms](#) used within the View.

The External Inputs and Form fields can be initialized when opening the View according to the settings defined on this list. The Inputs will be visible on the list after refreshing. To refresh the list of Inputs, click (Refresh). By default the list is empty (not refreshed). You can also open an DFC where the selected Input is used by clicking (Properties).

Column Name	Description
Enabled	If selected, the Input will be initialized (forced) with the provided value.
InputName	The External Input name (read-only).
Type	The External Input type (read-only).
Value	The value that will be passed to the Input.
MapInput	The existing Input from the current session will be passed to the value.
Override	The value will be overridden each time the Screen is reloaded.
SystemParameter	The existing System Parameter will be passed to the value.

When the parameter is of the Complex/List of Complex data type, the entire parameter row becomes uneditable.

Provide a value in only one of these fields: Value, MapInput, or SystemParameter.
